

NEW SOIL VAC

Thanks to aerospace technology the **Soil Vac** can lift and remove particles up to 50 mm including MOT Type 1 material.

Simply use the **Soil Pick** to loosen the granular material and then remove from the hole with the **Soil Vac**. There is no need for additional engines/transmissions as the **Soil Vac** is powered by the same compressor that runs the **Soil Pick**. Weighing less than 9 kg including the hoses, the all-new **Soil Vac** is fully portable and can easily be stored in the back of the van when not in use.

When the unit is fitted with the VB attachment valve boxes can be cleaned in seconds, allowing for safe work on the valve with no subsequent site cleaning, as the discharge tube can be fitted with a re-usable bag.

Unlike all other vacuum machines, in the unlikely event that the **Soil Vac** becomes blocked simply suck up a bucket of gravel to remove any built up material. Alternatively place the **Soil Pick** inside the vac tube and pull the trigger.

Key-hole is now possible without having to accommodate a huge trailer mounted vacuum unit.
